

# Automatic Design of Multi-Objective Local Search Algorithms

Case Study on a bi-objective Permutation Flowshop Scheduling Problem

Aymeric Blot   Marie-Éléonore Kessaci   Laetitia Jourdan

Université de Lille, Inria, UMR 9189 – CRIStAL

GECCO – July, 2017

# Context

## Metaheuristics: Highly Tunable Algorithms

### Key Points

- ▶ Approximation algorithms for optimisation problems
- ▶ Few assumptions about the problem
- ▶ Many parameters and strategies

### Performance

- ▶ Differs with the problem
- ▶ Differs with the instance
- ▶ Depends on its configuration (set of parameter values)

# Context

## Automatic Algorithm Configuration

### Single-Objective Configuration

- ▶ Learn the optimal configuration on a training instance set
- ▶ irace [López-Ibáñez *et al.*, 2016], ParamILS [Hutter *et al.*, 2009], SMAC [Hutter *et al.*, 2010], GGA++ [Ansótegui *et al.*, 2015], ...

### Multi-Objective Configuration

- ▶ MO-ParamILS [Blot *et al.*, LION 2016]
- ▶ Optimise multiple performance indicators

# Context

## Configuring Multi-Objective Algorithms

### Performance Indicators

- ▶ Convergence
- ▶ Diversity
- ▶ Spread
- ▶ Size

### Multi-Objective Configuration

- ▶ Configuring a MO algorithm is a MO problem [Blot *et al.*, EMO 2017]

# Motivation

## Designing Efficient Multi-Objective Metaheuristics

### Question

- ▶ How efficient is MO-AAC to design MO metaheuristics?

### Case Study

- ▶ MO-ParamILS
- ▶ Multi-objective Local Search algorithms
- ▶ Bi-objective Permutation Flowshop Scheduling Problem

# Case Study

## MOLS: Multi-objective Local Search Algorithms

### Key Points

- ▶ Efficient metaheuristics
- ▶ Used on many problems (e.g., scheduling, routing, assignment)
- ▶ Many strategies and parameters

### In the Literature

- ▶ Methods
  - ▶ Pareto Archived Evolution Strategy (PAES, 1999, 2000)
  - ▶ Pareto Local Search (PLS, 2001, 2004, 2011, 2012, 2015)
- ▶ Unifications
  - ▶ Stochastic Pareto Local Search (SPLS, 2012)
  - ▶ Dominance-based Multi-objective Local Search (DMLS, 2012)

# Multi-Objective Local Search Algorithms

## Simple Workflow

## Example Parameters

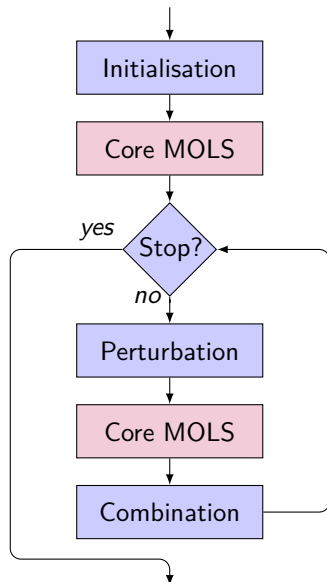

- ▶ Selection
  - ▶ Type and number of solutions
- ▶ Exploration
  - ▶ Neighbourhood
  - ▶ Reference point
  - ▶ Type and number of neighbours
- ▶ Archive
  - ▶ Archive size
  - ▶ Type of solutions

# Multi-Objective Local Search Algorithms

## Iterated Workflow

### Iterated Local Search (ILS)

[Lourenço *et al.*, 2003]

# MOLS Adaptability

## Highly Configurable

- ▶ Initialisation
- ▶ Selection
- ▶ Exploration
- ▶ Archive
- ▶ Iteration
- ▶ Perturbation

## Possible MOLS Parameters

Parameter	Type	Parameter values
<code>initStrat</code>	category	{ <code>rand</code> , <code>neh</code> , <code>ig</code> }
<code>selectStrat</code>	category	{ <code>all</code> , <code>rand</code> , <code>newest</code> , <code>oldest</code> }
<code>selectSize</code>	integer	1+
<code>explorStrat</code>	category	{ <code>all</code> , <code>imp</code> , <code>ndom</code> , ...}
<code>explorRef</code>	category	{ <code>pick</code> , <code>arch</code> }
<code>explorSize</code>	integer	1+
<code>archiveStrat</code>	category	{ <code>bounded</code> , <code>unbounded</code> , ...}
<code>archiveSize</code>	integer	1+
<code>iterationLength</code>	integer	1+
<code>iterationStagnation</code>	integer	1+
<code>perturbStrat</code>	category	{ <code>restart</code> , <code>kick</code> }
<code>perturbSize</code>	integer	1+
<code>perturbStrength</code>	integer	1+

# Experimental Protocol

Goal: Compare MO-AAC Performance to Exhaustive Analysis

## MO-ParamILS

- ▶ Training
- ▶ Validation
- ▶ Test

## Exhaustive Analysis

- ▶ Every possible configuration
- ▶ Only on the test set

## MOLS

- ▶ Optimise:
  - ▶ Convergence
  - ▶ Distribution
- ▶ Minimise:
  - ▶ 1 - Hypervolume
  - ▶  $\Delta$  Spread

# MO-ParamILS

## Training

Problem space

(execution on single instance)

- ▶ For every configuration
  - ▶ multiple runs
  - ▶ multiple instances
- ▶ Average  $HV$  and  $\Delta$  Spread over multiple runs

# MO-ParamILS

## Training

Problem space

(execution on single instance)

Configuration space

(average over training instances)

# MO-ParamILS

## Training

- ▶ iteratively investigates configurations
- ▶ refining quality estimations
- ▶ returns non-dominated
- ▶ shuffles training instances

# MO-ParamILS

## Training

- ▶ iteratively investigates configurations
- ▶ refining quality estimations
- ▶ returns **non-dominated**
- ▶ shuffles training instances

# MO-ParamILS

## Training

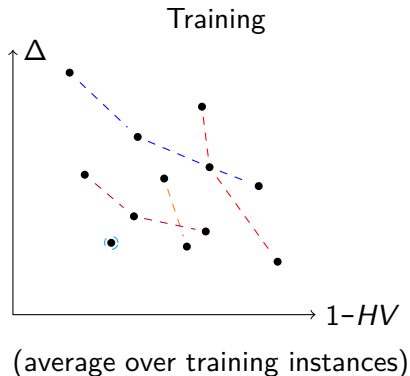

- ▶ iteratively investigates configurations
- ▶ refining quality estimations
- ▶ returns **non-dominated**
- ▶ shuffles training instances

# MO-ParamILS Protocol

Training, Validation, Test

- ▶ Training
  - ▶ 30 training runs
  - ▶ different instance subsets
  - ▶ incomparable quality estimation
- ▶ Validation
  - ▶ all training configurations
  - ▶ all training instances

# MO-ParamILS Protocol

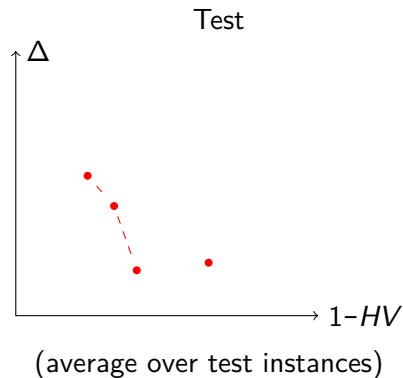

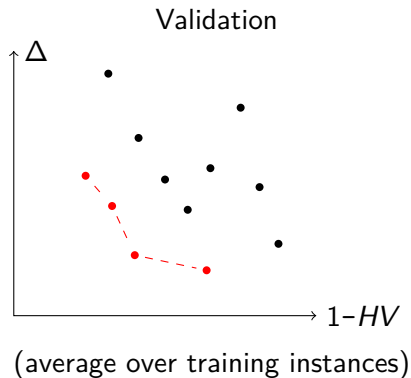

Training, Validation, Test

- ▶ Training
  - ▶ 30 training runs
  - ▶ different instance subsets
  - ▶ incomparable quality estimation
- ▶ Validation
  - ▶ all training configurations
  - ▶ all training instances

# MO-ParamILS Protocol

Training, Validation, Test

# Experimental Protocol

## Summary

### Permutation Flowshop Scheduling Problem

- ▶ Classical Taillard instances
- ▶ Bi-objective optimisation:
  - ▶ Makespan
  - ▶ Flowtime
- ▶ 3 scenarios:
  - ▶ 20-job instances
  - ▶ 50-job instances
  - ▶ 100-job instances

### 189 MOLS Configurations

Parameter	Parameter values
initStrat	{rand, neh, ig}
selectStrat	{all, rand, new, old}
selectSize	{1, 3}
explorStrat	{all, imp, ndom}
explorRef	{pick, arch}
explorSize	{1, 3}

### Total time

Approach	20-job	50-job	100-job
Training	36 min	90 min	3 hours
MO-AAC	2 days	7 days	15 days
Exhaustive	46 days	115 days	230 days

# Results

## Exhaustive analysis

PFSP Taillard instances – 50 jobs

PFSP Taillard instances – 100 jobs

## Exploration Selection Strategies

- ▶  $\Delta$  all
- ▶ o imp
- ▶ + ndom
- ▶  $\square$  all
- ▶  $\square$  newest
- ▶  $\square$  oldest
- ▶  $\square$  rand

# Results

## Exhaustive analysis

PFSP Taillard instances – 50 jobs

PFSP Taillard instances – 100 jobs

## Exploration / Selection Strategies

▶  $\Delta$  all

▶ o imp

▶ + ndom

▶ ■ all

▶ ■ newest

▶ ■ oldest

▶ ■ rand

# Results

## Exhaustive analysis

# Results

## Multi-Objective Automatic Design

PFSP Taillard instances – 50 jobs

## Optimal Configurations

Init	Selection	Exploration			
ig	oldest	3	imp	3	pick
ig	rand	3	imp	3	pick
ig	all	-	imp	1	arch
ig	newest	3	ndom	3	pick
ig	all	-	all	-	arch
ig	rand	1	ndom	1	arch
ig	newest	3	ndom	3	arch
ig	newest	3	ndom	1	arch
ig	oldest	3	ndom	1	arch
ig	oldest	3	ndom	3	arch

# Results

## Multi-Objective Automatic Design

PFSP Taillard instances – 50 jobs

## Optimal Configurations

Init	Selection	Exploration	•
ig	oldest	3 imp 3	pick
ig	rand	3 imp 3	pick
ig	all	- imp 1	arch ✓
ig	newest	3 ndom 3	pick
ig	all	- all -	arch ✓
ig	rand	1 ndom 1	arch
ig	newest	3 ndom 3	arch
ig	newest	3 ndom 1	arch
ig	oldest	3 ndom 1	arch
ig	oldest	3 ndom 3	arch ✓

# Results

## Multi-Objective Automatic Design

PFSP Taillard instances – 20 jobs

PFSP Taillard instances – 100 jobs

# Conclusion

## Main Contribution

- ▶ Efficient Automatic design of MOLS algorithms for bi-objective PFSP

## Perspectives

- ▶ Investigate automatic design on other problems
  - ▶ *e.g.*, MO-TSP, MO-QAP
- ▶ Extends to other algorithms
  - ▶ *e.g.*, GA, EA

## Additional Contribution

- ▶ New MOLS generalisation

# Wrap up

## Take-home Message 1

- ▶ Configuring a MO algorithm is a MO problem [Blot *et al.*, EMO 2017]

## Take-home Message 2

- ▶ Use configurable algorithms
  - ▶ Or expose tunable parameters
- ▶ Propose new components and strategies
- ▶ Design the final algorithm automatically
