Modelling of highly oscillatory phenomenon by neural networks

Maxime BOUCHEREAU - Université de Rennes (IRMAR)

PhD defense - 17^{th} October 2024

Ph. D supervisors: François CASTELLA - Philippe CHARTIER Mohammed LEMOU - Florian MEHATS

Motivation

Goal: Approximate solutions of highly oscillatory ODE's, of the form:

$$\begin{cases} \dot{y}^{\varepsilon}(t) &= f\left(\frac{t}{\varepsilon}, y^{\varepsilon}(t)\right) \\ y^{\varepsilon}(0) &= y_{0} \in \mathbb{R}^{d} \end{cases}$$
(1)

where $\tau \mapsto f(\tau, \cdot)$ is 2π -periodic, ε is a small parameter.

• Issue with standard methods: Error bound increasing when $\varepsilon \to 0$, e.g. with Forward Euler method: $y_{n+1} = y_n + hf\left(\frac{nh}{\varepsilon}, y_n\right)$:

$$\max_{0 \le n \le N} |y_n - y^{\varepsilon}(nh)| \le \frac{Ch}{\varepsilon}$$
(2)

(ロ) (日) (日) (日) (日)

Autonomous case: f is independent from τ : $\dot{y}(t) = f(y(t))$

Definition (Modified field w.r.t. a numerical method)

Let consider a one step numerical method $\Phi_h(\cdot)$. The modified vector field w.r.t. Φ_h , denoted \tilde{f}_h , is defined by the relation:

$$\varphi_{nh}^{f}(y_0) = \left(\Phi_h^{\tilde{f}_h}\right)^n(y_0) \tag{3}$$

Proposition (Properties of the modified field)

• Formal serie w.r.t. h: If
$$\Phi$$
 is of order p , then
 $\tilde{f}_h(y) = f(y) + h^p f_1(y) + h^{p+1} f_2(y) + \cdots$

• **Truncated modified field:** Let consider $\tilde{f}_h^{[q]}$ the truncated modified field $\tilde{f}_h^{[q]}(y) = f(y) + h^p f_1(y) + \dots + h^{p+q-2} f_{q-1}(y)$. Thus we have

$$\lim_{n \leq N} \left\| \left(\Phi_h^{\tilde{f}_h^{[q]}} \right)^n (y_0) - \varphi_{nh}^f(y_0) \right\| \leq C h^{p+q-1}$$

Backward error analysis for autonomous ODE's Highly oscillatory ODE's: theory & UA methods

Highly oscillatory ODE's: Structure of solutions of $\dot{y}^{\varepsilon}(t) = f\left(\frac{t}{\varepsilon}, y^{\varepsilon}(t)\right)$

Theorem (P. Chartier, A. Murua, and J.M. Sanz-Serna - 2015)

There exists ε_0 s.t. for all $\varepsilon \in (0, \varepsilon_0]$, there exists $n_{\varepsilon} \in \mathbb{N}$ s.t. For all $t \in [0, T]$:

$$\left| y^{\varepsilon}(t) - \phi^{\varepsilon, [n_{\varepsilon}]}_{t} \left(\varphi^{F^{\varepsilon, [n_{\varepsilon}]}}_{t}(y_{0}) \right) \right| \leq M e^{-\frac{\beta \varepsilon_{0}}{\varepsilon}}$$
(9)

where:

 $F^{\varepsilon,[n_{\varepsilon}]}$ is the truncation at order $\mathcal{O}(\varepsilon^{n_{\varepsilon}})$ of averaged field F^{ε} . Structure: $F^{\varepsilon}(y) = \langle f \rangle(y) + \varepsilon F_1(y) + \varepsilon^2 F_2(y) + \cdots$, where $\langle f \rangle$ is the average field w.r.t. time variable:

$$\langle f \rangle(y) := \frac{1}{2\pi} \int_0^{2\pi} f(\tau, y) \mathrm{d}\tau$$
 (10)

• $\phi_{\tau}^{\varepsilon,[n_{\varepsilon}]}$ is the truncation at order $\mathcal{O}(\varepsilon^{n_{\varepsilon}})$ of high oscillation generator $\phi_{\tau}^{\varepsilon,[n_{\varepsilon}]}(y) = y + \varepsilon \tilde{\phi}_{1}(\tau,y) + \varepsilon^{2} \tilde{\phi}_{2}(\tau,y) + \cdots$ (Near to identity mapping) and is 2π -periodic w.r.t. τ .

Training

Training of the neural network: Optimization of:

$$Loss_{Train} = \frac{1}{K_0} \sum_{k=0}^{K_0-1} \frac{1}{h^{(k)^{2p+2}}} \left| \underbrace{\Phi_{h^{(k)}}^{f_{\theta}(\cdot,h^{(k)})}(y_0^{(k)})}_{=\hat{y}_1^{(k)}} - y_1^{(k)} \right|^2$$

Good training: *Loss*_{*Train*} has the same decay pattern as:

$$Loss_{Test} = \frac{1}{K - K_0} \sum_{k=K_0}^{K-1} \frac{1}{h^{(k)^{2p+2}}} \left| \Phi_{h^{(k)}}^{f_{\theta}(\cdot,h^{(k)})}(y_0^{(k)}) - y_1^{(k)} \right|^2$$

• At the end of the training: Good approximation f_{θ} of $\tilde{f}_{h}^{[q]}$ (only one training required).

• At the end of the training: Good approximation f_{θ} of $\tilde{f}_{h}^{[q]}$ (only one training required).
Autonomous ODE's

Numerical integration

Numerical integration: We get a small numerical error:

$$e_{\theta,n} = \left(\Phi_h^{f_\theta(\cdot,h)}\right)^n (y_0) - \varphi_{nh}^f(y_0) \tag{17}$$

Denoting the **learning error** by

$$\delta := \max_{(y,h)\in\Omega\times[0,h_+]} \frac{\left|\tilde{f}_h^{[q]}(y) - f_\theta(y,h)\right|}{h^p}$$
(18)

Theorem (M.B, P.Chartier, M.Lemou, F.Méhats - 2023¹)

Assuming that

• For any pair smooth vector fields f_1 and f_2 , we have

$$\forall 0 \le h \le h_+, \quad \left\| \Phi_h^{f_1} - \Phi_h^{f_2} \right\|_{L^{\infty}(\Omega)} \leqslant Ch \| |f_1 - f_2||_{L^{\infty}(\Omega)}$$
(19)

for some positive constant C, independent of f_1 and f_2 ;

• For any smooth vector field f, there exists a constant L > 0 such that $\forall 0 \le h \le h_+, \forall (y_1, y_2) \in \Omega^2$:

$$\Phi_{h}^{f}(y_{1}) - \Phi_{h}^{f}(y_{2}) \bigg| \leq (1 + Lh) |y_{1} - y_{2}|.$$
(20)

Then there exists positive constant C_{θ} such that:

$$\underset{0 \leq n \leq N}{\operatorname{Max}} |e_{\theta,n}| \leq C_{\theta} \delta h^p \tag{21}$$

Introduction and previous results	
Autonomous ODE's	
Extension to highly oscillatory ODE's	

Goal: Find an approximation of the solution of

$$\begin{cases} \dot{y}^{\varepsilon}(t) = f\left(\frac{t}{\varepsilon}, y^{\varepsilon}(t)\right) \\ y^{\varepsilon}(0) = y_{0} \end{cases}$$
(25)

• General strategy: Use the decomposition (9)

$$y^{\varepsilon}(t) \approx \phi^{\varepsilon, [n_{\varepsilon}]}_{\frac{t}{\varepsilon}} \left(\varphi^{F^{\varepsilon, [n_{\varepsilon}]}}_t(y_0) \right)$$
(26)

< ロト < 同ト < ヨト < ヨト

in order to approximate $F^{\varepsilon,[n_{\varepsilon}]}$ and $\phi^{\varepsilon,[n_{\varepsilon}]}(\cdot)$ with neural networks.

Introduction and previous results

(34)

• **Numerical integration for Micro part:** We introduce Micro part vector field:

$$g_{\theta}(\tau, w, v, \varepsilon) := f(\tau, \phi_{\theta}(\tau, v, \varepsilon) + w) - \frac{1}{\varepsilon} \partial_{\tau} \phi_{\theta}(\tau, v, \varepsilon) \quad (35)$$
$$- \partial_{y} \phi_{\theta}(\tau, v, \varepsilon) F_{\theta}(v, 0, \varepsilon)$$

$$\begin{cases} w_{\theta,0} = 0 \\ \forall n \in \mathbb{N}, \quad w_{\theta,n+1} = \Phi_{nh,h}^{g_{\theta}\left(\frac{nh}{\varepsilon}, \cdot, v_{\theta,n}, \varepsilon\right)}(w_{\theta,n}) \end{cases}$$
(36)

Approximation of the solution:

$$\forall n \in \mathbb{N}, \quad y_{\theta,n}^{\varepsilon} = \phi_{\theta} \left(\frac{nh}{\varepsilon}, v_{\theta,n}, \varepsilon \right) + w_{\theta,n}. \tag{37}$$

Numerical integration inspired from Micro-Macro method

• Let introduce both learning errors:

$$\delta_{\phi} := \left\| \frac{\phi^{[p]} - \phi_{\theta}}{\varepsilon} \right\|_{W^{1,\infty}(\Omega \times [0,2\pi]), L^{\infty}([0,\varepsilon_{+}])}$$
(38)
$$\delta_{F} := \left\| \widetilde{F_{h}^{\varepsilon,[p],[q]}} - F_{\theta} \right\|_{L^{\infty}(\Omega \times [0,h_{+}] \times [0,\varepsilon_{+}])}$$
(39)

Introduction and previous results	General Framework

Theorem (M.B., P.Chartier, M.Lemou, F.Méhats - 2024)

Assuming that

• For $f_1, f_2: [0,T] \times \Omega \to \mathbb{R}^d$ smooth enough and $t \in [0,T]$, we have, for all h > 0,

$$\left| \left| \Phi_{t,h}^{f_1} - \Phi_{t,h}^{f_2} \right| \right|_{L^{\infty}(\Omega)} \leqslant Ch \left| \left| f_1 - f_2 \right| \right|_{L^{\infty}(\Omega)}$$
(40)

for some positive constant C > 0 independent from f_1 and f_2 .

• For $f: [0,T] \times \Omega \to \mathbb{R}^d$ smooth enough and $t \in [0,T]$, there exists $L_f > 0$ s.t. for all $y_1, y_2 \in \Omega$, for all h > 0, we have

$$\left| \Phi_{t,h}^{f}(y_{1}) - \Phi_{t,h}^{f}(y_{2}) \right| \leq (1 + L_{f}h)|y_{1} - y_{2}|$$
(41)

Then there exists positive constants C', M' such that:

$$\underset{0 \leq n \leq N}{Max} |e_{\theta,n}| \leq M' h^p + C' [\delta_F + \delta_{\phi}]$$
(42)

Numerical test: Van der Pol oscillator - Forward Euler

 $\begin{cases} \dot{q} = \frac{1}{\varepsilon}p\\ \dot{p} = -\frac{1}{\varepsilon}q + \left(\frac{1}{4} - q^2\right)p. \end{cases}$ (43)

by making the variable change $(y_1, y_2) \mapsto S\left(\frac{t}{\varepsilon}\right)(q, p)$, where $\tau \mapsto S(\tau)$ is given by

$$\tau \longmapsto S(\tau) = \begin{bmatrix} \cos(\tau) & -\sin(\tau) \\ \sin(\tau) & \cos(\tau) \end{bmatrix}$$
(44)

we get the system:

$$\begin{cases} y_1(t) &= -\sin\left(\frac{t}{\varepsilon}\right) \left[\frac{1}{4} - \left(y_1(t)\cos\left(\frac{t}{\varepsilon}\right) + y_2(t)\sin\left(\frac{t}{\varepsilon}\right)\right)^2\right] \left[-y_1(t)\sin\left(\frac{t}{\varepsilon}\right) + y_2(t)\cos\left(\frac{t}{\varepsilon}\right)\right] \\ y_2(t) &= \cos\left(\frac{t}{\varepsilon}\right) \left[\frac{1}{4} - \left(y_1(t)\cos\left(\frac{t}{\varepsilon}\right) + y_2(t)\sin\left(\frac{t}{\varepsilon}\right)\right)^2\right] \left[-y_1(t)\sin\left(\frac{t}{\varepsilon}\right) + y_2(t)\cos\left(\frac{t}{\varepsilon}\right)\right] \end{cases}$$

Numerical test: Van der Pol oscillator - Forward Euler

Parameters		
# Math Parameters:		
Interval where time steps are selected:	$[h_{-}, h_{+}] = [10^{-3}, 10^{-1}]$	
Interval where small parameters are selected:	$[\varepsilon_{-}, \varepsilon_{+}] = [10^{-3}, 1]$	
Time for ODE simulation:	T = 1	
Time step for ODE simulation:	h = 0.01	
High oscillation parameter for ODE simulation:	$\varepsilon = 0.1$	
# Machine Learning Parameters:		
Domain where initial data are selected:	$\Omega = [-2, 2]^2$	
Number of data:	K = 20000000	
Proportion of data for training:	$80\% - K_0 = 16000000$	
Hidden layers per MLP:	2	
Neurons on each hidden layer:	200	
Epochs:	200	

Computational time for data creation: 2 Days 8 h 2 min 30 s Computational time for training: 3 Days 13 h 50 min 30 s

- 4 Conclusion and perspectives

メロト メタト メヨト

Conclusion - Main results:

- Performing of existing numerical methods to solve autonomous ODE's by usine Machine Learning to approximate truncated modified field¹.
- Approximation of averaged field and high oscillation generator (truncations) for highly oscillatory ODE's by adding auto-encoders².

Research perspectives:

• Include geometric properties for approximation of truncated averaged field and high oscillation generator (e.g. Hamiltonian equation of divergence free).
